2018 Business Briefing (Payment Services)

December 10, 2018
Representative Director and Senior Executive Vice President
Shigeki Yamaguchi

Self-introduction

Shigeki Yamaguchi

■ **Business experience**

Apr 1984 Joined NTT DATA
- Engaged in development of middle software for shared scientific computation systems
- Project leader of system development for distribution industry, etc.

Jul 2010 Head of Enterprise Business Consulting Marketing Sector
- Engaged in establishment of NTT Data Business Consulting Corporation, a predecessor of QUNIE CORPORATION, a consulting firm of NTT DATA Group, and concurrently served as Director and Executive Vice President

Jan 2013 Representative Director and Senior Managing Director of JSOL Corporation
- Engaged in expansion of SAP business

Jun 2013 Senior Vice President, Head of Business Consulting & Marketing Sector
- In charge of consulting and ERP (Biz∫) business

Jun 2014 Senior Vice President, Head of Third Enterprise Sector
Jun 2016 Executive Vice President, Head of IT Services & Payments Services Sector
- In charge of payment business, distribution and service industries

Jun 2017 Director and Executive Vice President, Responsible for Enterprise & Solutions Segment and China & APAC Segment
**Jun 2018 Representative Director and Senior Executive Vice President**

■ **Area of expertise**
Digital commerce, payment, and consulting

INDEX

NTT DATA

1. Domestic payment business

NTT DaTa

1.1 State of payment systems in Japan

NTT DaTa

Forecast of payment method composition

- Though domestic consumer spending remains flat at little more than 300 trillion yen/year, the ratio of non-cash payment is expected to rise.
- Based on current trends, it is expected to rise to nearly 30% in 2020 and nearly 45% in 2025.

Projected composition of non-cash payments within consumer spending

Trillion yen / %

NCP ratio values: 19.4 (2015), 21.6 (2016), 23.7 (2017), 25.4 (2018), 27.1 (2019), 29.3 (2020), 32.1 (2021), 34.4 (2022), 35.9 (2023), 40.3 (2024), 46.3 (2025)

Legend: Prepaid type (prepaid card & e-money) · Debit card · Credit card · Cash, etc. · NCP ratio
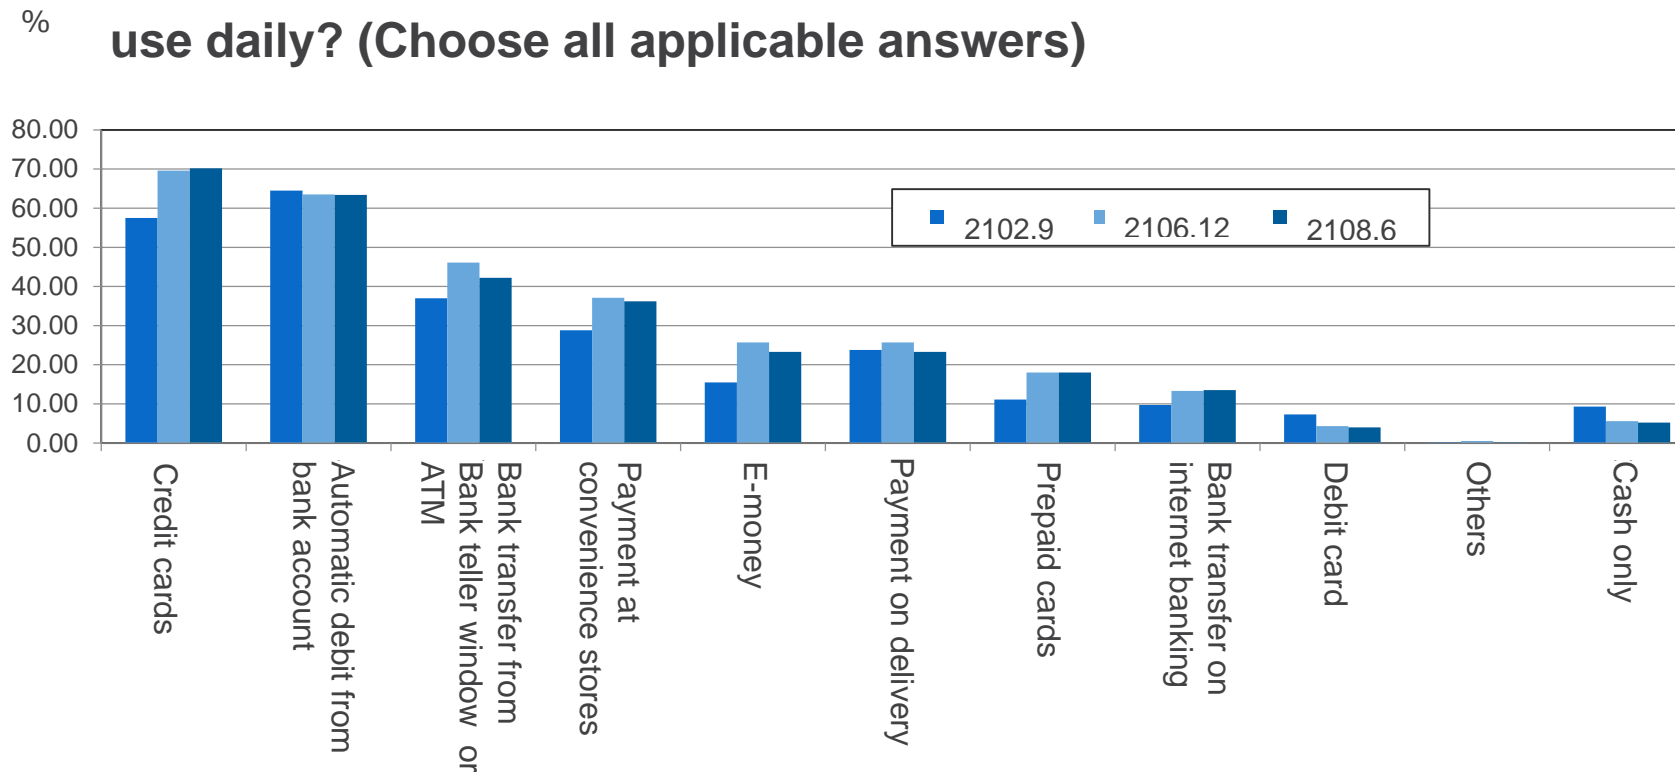

Source: Calculated by NTT Data Institute of Management Consulting based on CAGR calculated using estimated values from 2015 to 2023 in Private Consumption (2015 to 2027) "'Research on the medium- and long-term economic growth prediction by macro-economic model' (March 2015) of METI commissioned survey", Cashless Payment Method (2015 to 2023) "'Fig. 6.1-2 Smart payment market forecast' (P219) in 'IT Navigator 208 Nemban' of Nomura Research Institute", Cashless Payment Method (2024 to 2025) "Estimate of Nomura Research Institute"

NTT DaTa

Payment-method options for individuals

• Although the measurement points are not continuous (comprising 2012, 2016, and 2018), the trend since 2012 is clear. The use of payment methods like credit cards, payment at convenience stores, e-money, and pre-paid cards is growing, while the percentage of consumers using cash only is down to around 5% from around 10%.

Which of the following payment instruments other than cash do you use daily? (Choose all applicable answers)

%

Legend: ■ 2102.9 ■ 2106.12 ■ 2108.6

Categories (x-axis): Credit cards, Automatic debit from bank account, ATM, Bank teller window or Bank transfer from, Payment at convenience stores, E-money, Payment on delivery, Prepaid cards, Bank transfer on internet banking, Debit card, Others, Cash only

NTT DaTa

Important factors when choosing a payment method

- Reward points and discounts are seen as the most important factors.
- In addition, "amount of payment" is another major basis for choosing a payment method.

Which of the following is/are the major factor(s) that you consider when choosing a payment instrument to make daily payments? (Choose all applicable answers)

Source: Bank of Japan, *Opinion Survey on the General Public's Views and Behavior*

9

Trend toward e-commerce

- The e-commerce market is growing continuously. Although the growth rate declined in FY15, it began rising again in FY16.

B-to-C e-commerce market in Japan (100mn yen)

Source: METI: *E-Commerce Market Survey*

E-commerce payment methods

- Generally, 70% of e-commerce uses credit payment. Around 20% of e-commerce transactions are paid by the convenience store payment. There are not much difference in its proportion every year.

Legend (both charts):

1.2 Scheme of major payment methods

NTT DaTa

Credit card payment scheme

- The main players of credit cards issued by international brands are: international brands, issuers, acquirers, and merchants.
- Services such as CAFIS and CDS provided by NTT DATA are used as payment infrastructure for processing transaction data (authorization data and sales data) of credit cards.

Users

● Cardholder bank account maintenance
● Cardholder bank account settlement

In general
・credit cards are issued by credit card companies
・debit cards are issued by banks
・pre-paid cards are issued by both credit card companies and banks

Issuer

Payment Infrastructure
(CAFIS, etc.)

International brands

● Brand value enhancement
● Consideration of risk layout and rules establishment and management
● Brand promotion

NTT DaTa

E-money (chip format) categories

- There are four main e-money (chip format) categories (post-paid and pre-paid of independent players, pre-paid of public transportation companies, and pre-paid of retail companies) in Japan.
- Because commuter passes are by necessity highly portable, they have won widespread adoption as a form of e-money.

Service Category	Electronic money			
	Post-paid (credit)	**Pre-paid**		
Provider	Independent players		Public transportation companies	Retail companies
Service	iD	Edy	Suica	WAON
	QUICPay		PiTaPa	nanaco
			ICOCA	
			PASMO	
			etc /15 application	
Chip format	Felica（Type C）			
Index	Electronic money member 151 million (Edy,Suica,PASMO,ICOCA,nanaco,WAON,iD)			

15

NTT DaTa

E-money payment scheme

- Card companies are the major acquirers, as in the credit card payment.
- Meanwhile, players who have contact with users (consumers) exist as individual brands playing the role of an issuer. (Categorized into public transportation companies, retail companies, and independent players)
- Credit cards, bank payments, cash, etc. exist as recharge accounts.

NTT DaTa

# 1.3 Basic services provided by CAFIS

NTT DaTa

Payment value chain

- In the payment value chain, NTT DATA provides payment terminals (INFOX/CAFIS Arch) installed at the merchants, and mainly provides switching services (CAFIS/CDS) of merchant processing centers (CAFIS BlueGate, CAFIS PastelPort, INFOX, CAFIS Arch), authorization and sales data.

Merchant | **Payment Value Chain** | **Consumer**

	Payment terminal	Payment agency service	Acquirer processing	Merchant processing	Switching network	Issuer processing	Clearing	Payment method provision
Provided value	・Payment process ・・・	・Payment service agency (simplification of complex procedures)	・Merchant recruiting ・Merchant management ・・・	・Sales data creation service for card companies, sales total data returns for merchants ・Security measures	Switching (online/sales data switching)	・Card issue ・Member management ・Credit management/balance management ・・・	・Sales settlement	・License provision ・Payment regulation establishment/management ・・・
Credit (EC merchants)	−	Payment service provider (PSP)	Acquirer (card companies, etc.)	**CAFIS BlueGate**	**CAFIS** / **CDS**	Issuer (card companies)		International brand

E-money (IC chip type pre-paid)				**INFOX**	E-money Relay operator	E-money brands (Suica, nanaco, etc.)		

Legend Scope of service provided by NTT DATA

18

NTT DaTa

Basic services provided by CAFIS

- All merchants, card companies, and financial institutions connected to CAFIS comprise CAFIS' network value. The wide coverage of merchants and the fact that almost all card companies and financial institutions are connected, are the advantages of CAFIS.
- It also provides merchant processing services according to types of merchants.
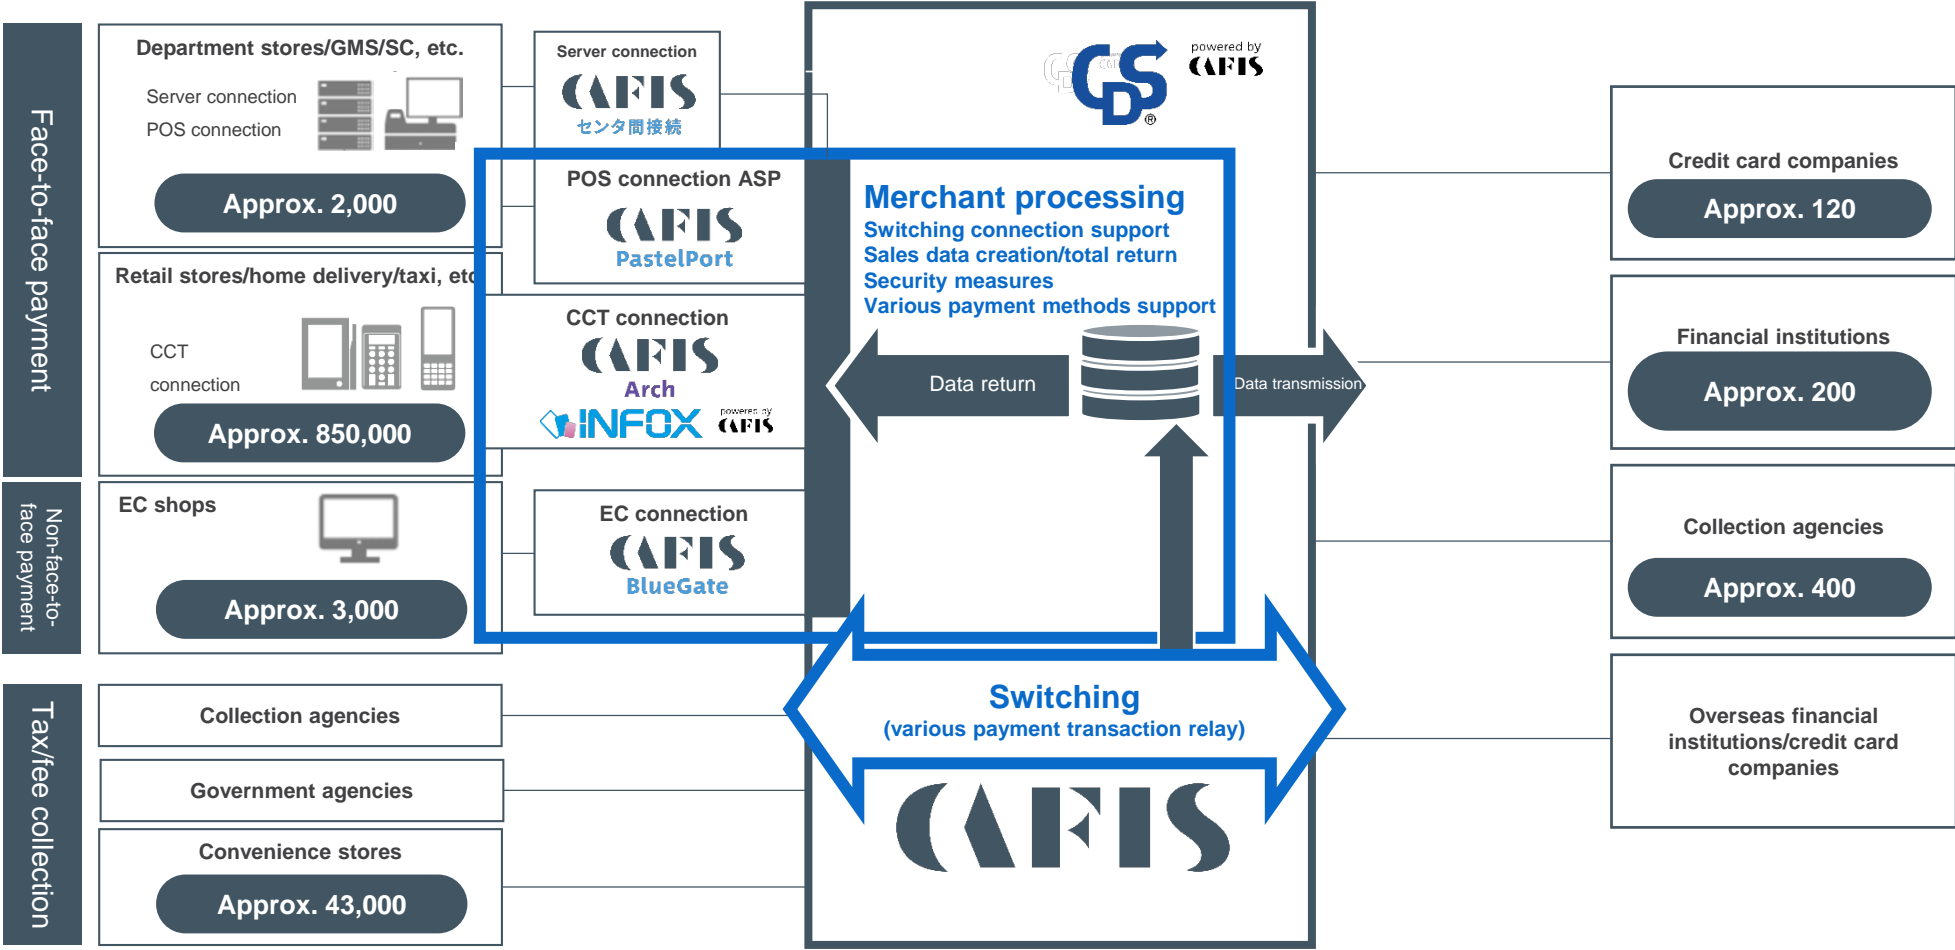

Changes in the number of CAFIS transactions

- The number of CAFIS transactions reached the 700mn/month mark in FY2017.
- We expect this number to continue growing following the shift to cashless payments.

Feb 1984: Launch of CAFIS comprehensive card payment network

Jun 1992: Launch of CDS credit data transmission service

Apr 1998: Launch of CAFIS 24-hour nonstop service

Jul 1999: Launch of INFOX card payment terminal solutions service

Oct 2000: Establishment of double-center system for CAFIS (one in Tokyo, one in Chiba)

Sep 2002: Launch of CAFIS BlueGate online payment service

Apr 2004: Launch of CAFIS PastelPort card payment solutions service for retailers

Sep 2006: Establishment of double-center system for INFOX (one in Tokyo, one in Chiba)

Feb 2008: PCI DSS certification for CAFIS obtained

Mar 2012: Establishment of double-center system for CAFIS and INFOX (one in Tokyo, one in Osaka)

Apr 2012: Launch of CAFIS DCC multi-currency payment service

Dec 2013: Launch of CAFIS Brain unauthorized online payment detection service

**Feb 2014:** Launch of PaySupreme next-generation pre-paid card service

Oct 2014: Launch of CAFIS Presh next-generation sales promotion platform

Jun 2015: Launch of CAFIS Arch cloud-based comprehensive payment platform

Sep 2017: Launch of CAFIS Attendant multi-language product explanation and marketing service

Feb 2018: Launch of CAFIS Traveler service for visitors to Japan

Apr 2018: Launch of CAFIS Pitt smartphone payment system

NTT DaTa

1.4 Changes in the payment market

NTT DATA

Changes in the payment market

- The payment market is changing significantly having large impact (opportunity/threat) on CAFIS business.
- Details of the impact will be explained from the next page.

①Diversifying payment methods

- Various payment players are on the rise such as XX pay, using QR codes
- Existing payment methods shifting to mobile wallets

| Apple Pay | ALIPAY | 楽天Pay |
| Google Pay | Wechat | LINE Pay |
②Change on the merchants' side

- Increasing need for payment service providers (PSP) managing the merchants
- Digitalization of purchasing experience (Recommendations, etc. based on purchase history)

CAFIS
Beyond The Payments

③Changes on the financial institutions' side

- Trend of financial institutions shifting to Open-API (provision of update system API)

④Advancing security measures

- Increasing unauthorized use of credit cards
- Sophistication of security regulations inside/outside Japan for preventing unauthorized use of credit cards such as international brand regulations and PCIDSS (compliance, etc. with revised Installment Sales Act, 3-D Secure2.0)

22

NTT DaTa

①Diversifying payment methods

NTT DaTa

QR code payment market

- Given the growth of inbound demand, the scale of domestic market for QR code payments is estimated as 600 billion yen in 2019 and 8 trillion yen in 2023. The market is crowded with all sorts of QR code payment providers while there is a high expectation for market growth.
- Adding to Chinese QR market (Alipay, WeChatPay), expansion of QR market is expected in the Asian region and Japan.
Inbound market

> Foreign tourist spending in Japan

4.4 trillion yen /year

2017

6.4 trillion yen /year

- d払い
- ORIGAMI Pay
- 楽天Pay
- PayPay
- amazon pay
- mercari
- au WALLET
- pring
- paidy

24

NTT DaTa

Expansion of NFC payment

- In addition to QR code, payment method using NFC (Felica in Japan) as an interface is expanding.
- Domestic use of ApplePay has been enabled since October 2016.
  (The scheme involves the existing payment scheme.)

Pre-paid
Suica

Note) NFC: abbreviation for Near Field Communication. Short distance wireless communication.

NTT DaTa

Growth of electronic wallet as a touch point

- Wallet apps are being promoted as a touch point with consumers because they store account information or link user IDs to account information.
  - Electronic wallets with exclusive scheme use existing payment scheme as a recharge account for balance.
  - Electronic wallets managing existing payment scheme have basically the same payment scheme as the existing scheme though consumer I/F is not the same.
  - Even in cases where QR codes or NFC is used instead of a card as a consumer interface, if an existing payment scheme is used as recharge /payment account, services provided by CAFIS can be leveraged.

26
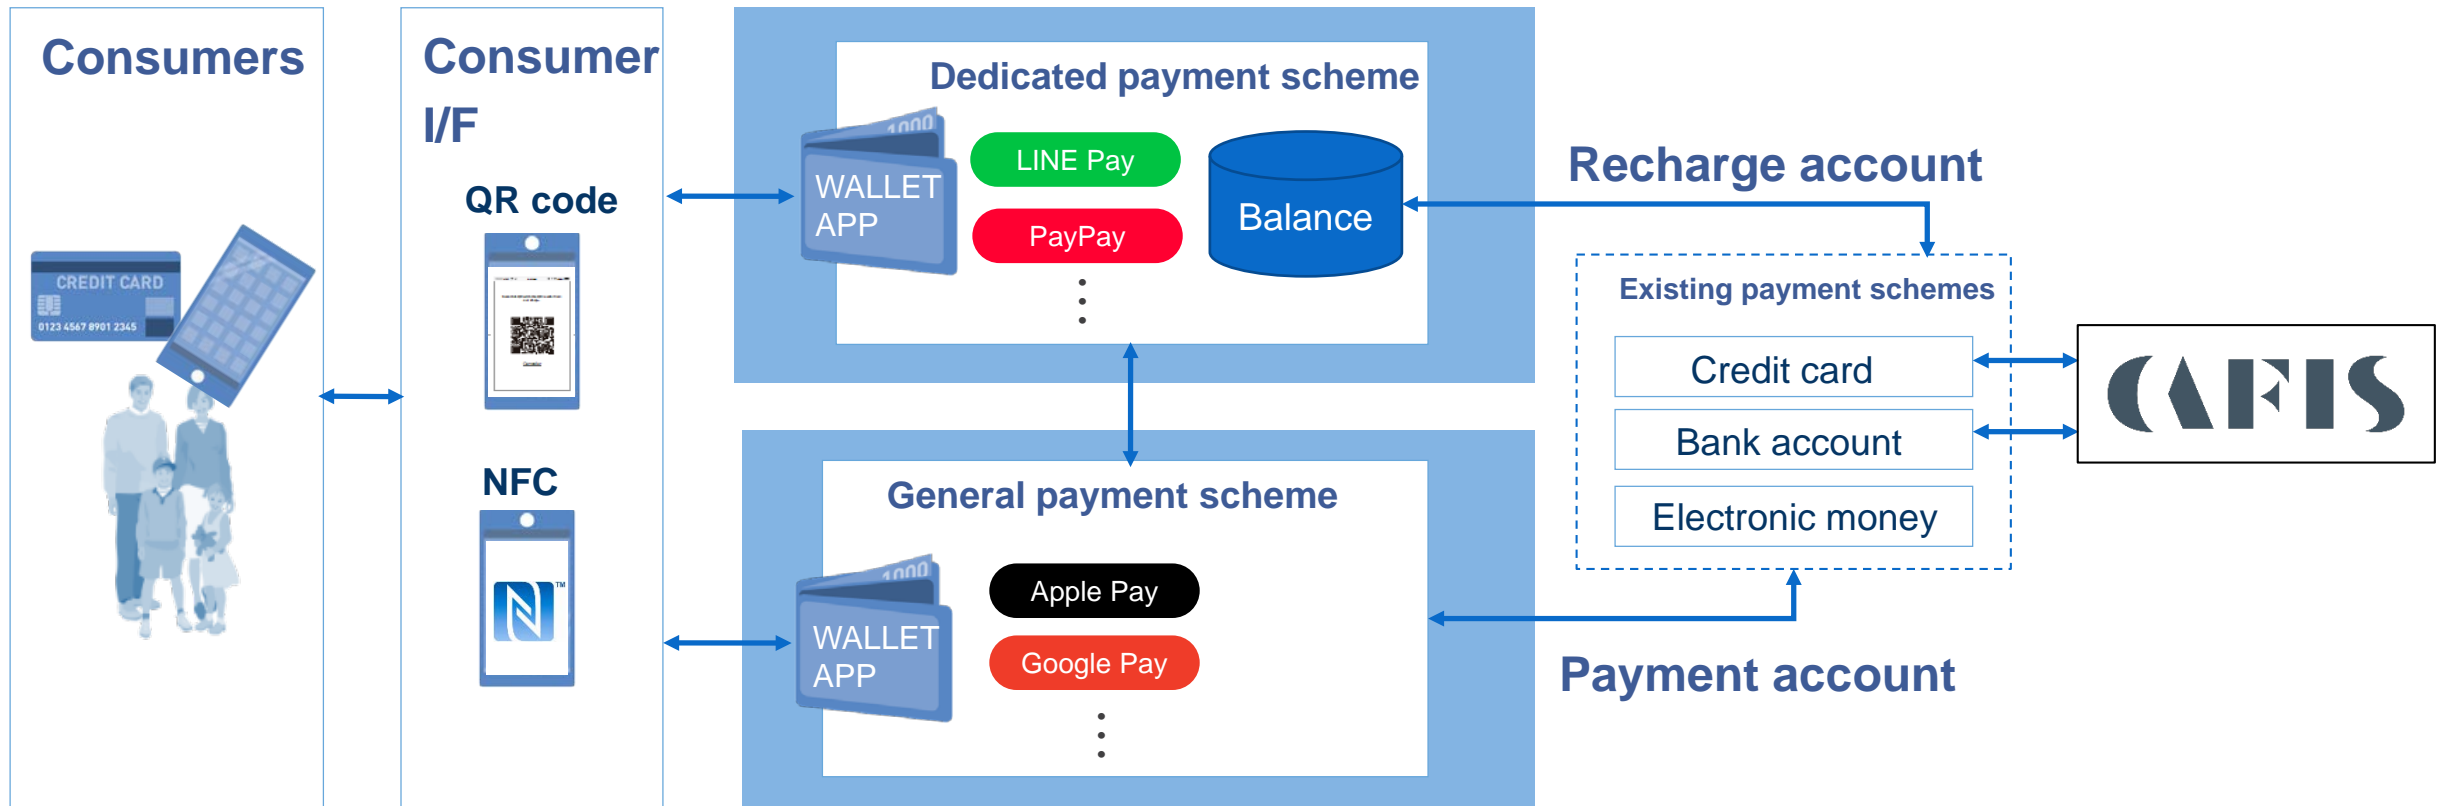

Structure of new payment method

- Unlike the 4 party model for credit cards, the new payment method has payment players acting as a brand and issuer. (3 Party Model)
- There is a possibility of expansion due to evolution of network environment, reduction of business layers, etc.

4 Party Model

3 Party Model

NTT DaTa

②Changes on merchants' side

NTT DaTa

# Increasing need for payment service

NTT DaTa

Increasing need for payment service

- In the past, acquirers were responsible for acquiring and managing merchants and for most of the added-values of merchant handling.
- EC requires support for various payment methods including credit payment and convenience store payment. However, coordination with multiple acquirers and development of systems considering security takes a lot of time and labor.
- Payment service providers (PSP) act as an agent providing such services and due to the recent expansion of online-to-offline needs, use of tablet POS, etc., trouble for merchants are further increasing and the need for payment agent (merchant agent function) is growing.

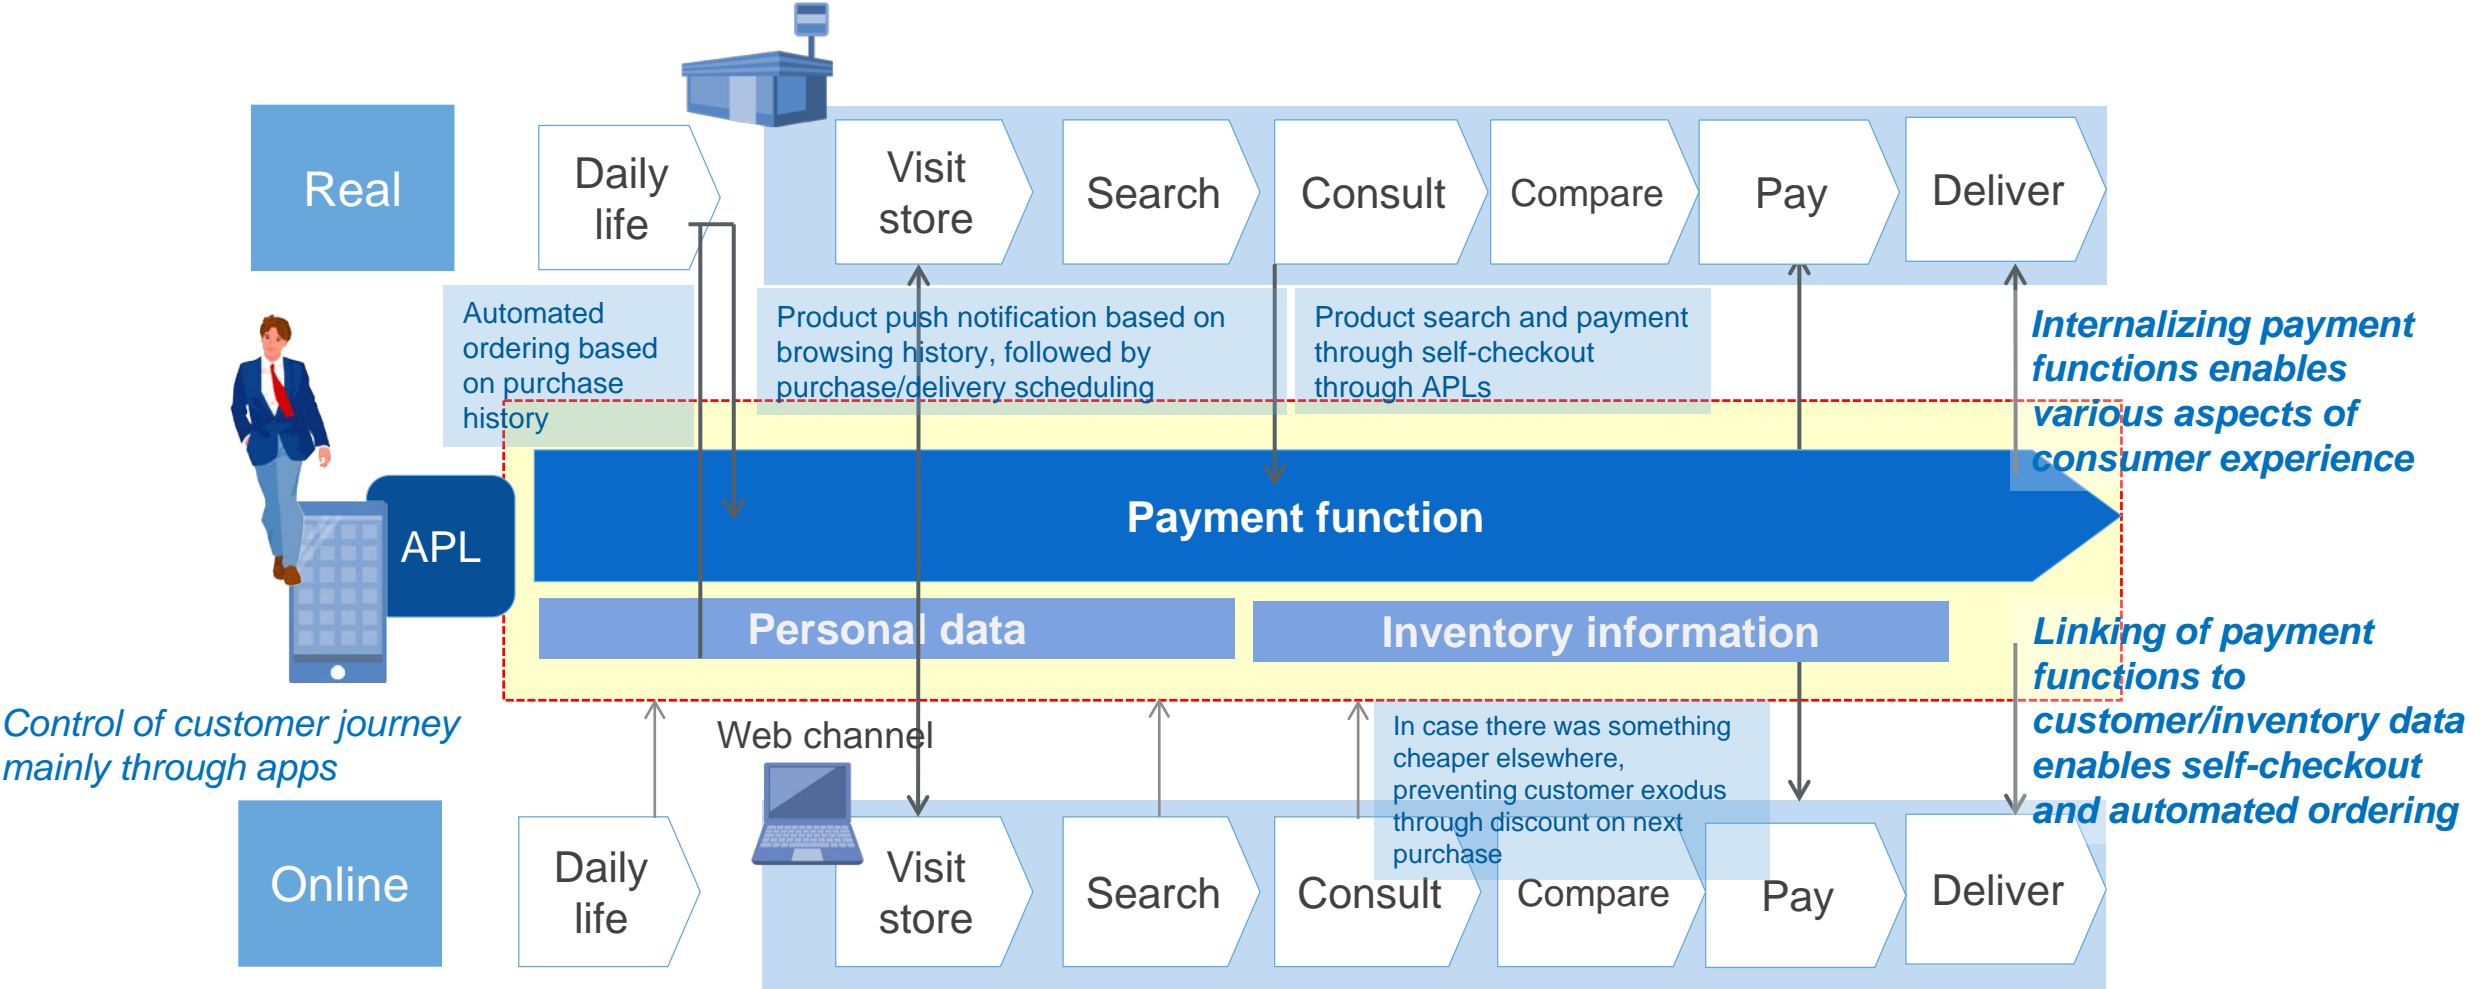

Past
Current trend

# Digitalization of purchase experience

NTT DaTa
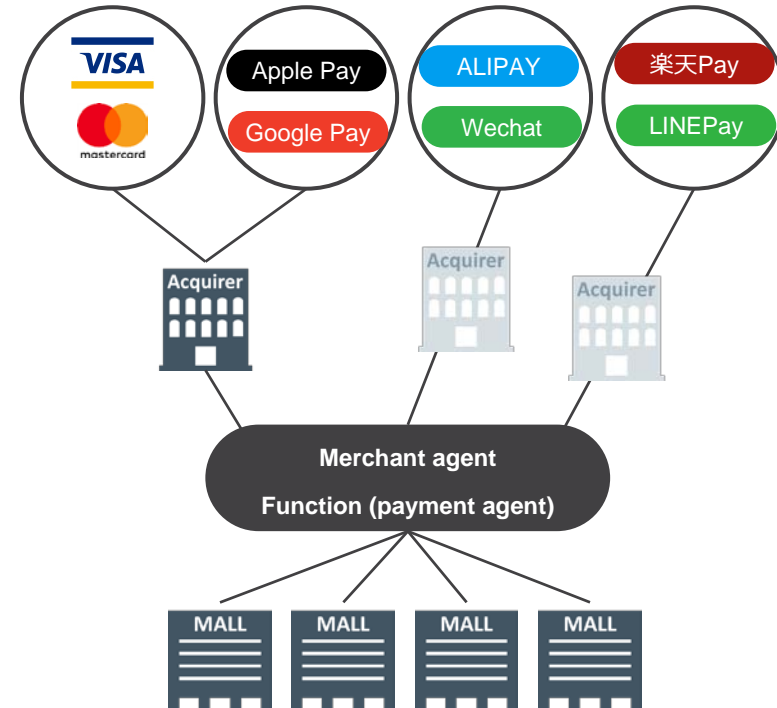

Digitalization of purchase experience

- Due to the expansion of smartphones, digitalization of consumers' overall purchase experience is taking shape.
- The payment services required amid the digital marketing trend are the ones that allow seamless access to payment to enable purchase actions at any stage in the consumer's purchasing experience.

Real

Daily life → Visit store → Search → Consult → Compare → Pay → Deliver

Automated ordering based on purchase history

Product push notification based on browsing history, followed by purchase/delivery scheduling

Product search and payment through self-checkout through APLs

Internalizing payment functions enables various aspects of consumer experience

APL

Collectively provided via cloud

Payment function — PSP

EMV NFC機能

- In the past, cash registers were provided by POS vendors and payment terminals, etc. were provided by card companies, payment service providers (PSP), etc.
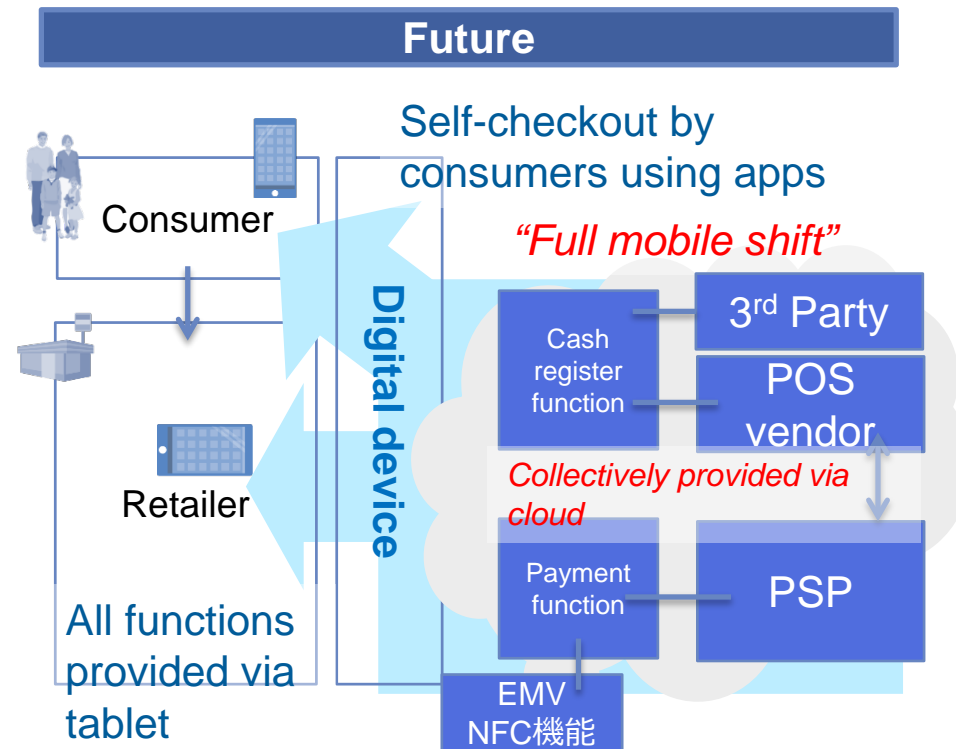

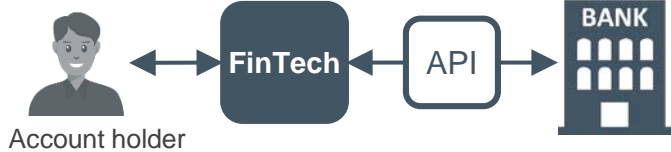

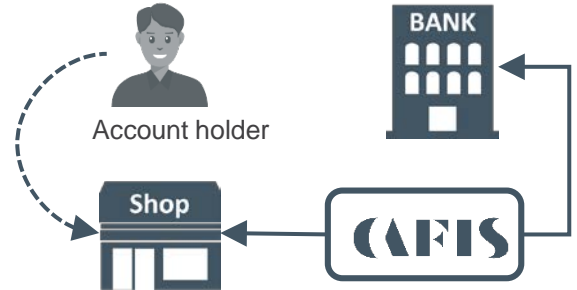

- Barriers between conventional POS vendors and payment players are collapsing
- Merchant touch points are contained in tablets with cash register and payment functions and provided to digital merchant touch points
- Started to use apps for consumer touch points also, providing self-checkout services, etc.

NTT DaTa

③Changes on the financial institutions' side

NTT DaTa

Trend of financial institutions shifting to Open-API

- Open-API is a technology which enables secure data interchange with external companies.
- FinTech companies, etc. are expected to leverage bank systems as shared platform, develop/provide various services, and implement open innovation in financial industry.
- Meanwhile, CAFIS has maintained standard I/F for financial institutions and provided multibank support services for retailers, etc.

		Open-API		CAFIS
①	Service structure	Series model	⇔	Triangular model
②	Actors of transactions	Account holder (individuals, companies)	⇔	Shops (merchants that have contract with banks)
③	Applicable operations	Update system: transfer Reference system: balance inquiry/detail inquiry	⇔	Shopping/direct debit/ ATM deposit/withdrawal, etc.
④	Features	Intended for banks to provide superior services to account holders. ⇒Individual bank service	⇔	Intended to provide highly convenient services to merchants. ⇒Multi-bank service

CAFIS' superiority in shifting to Open-API

- In case multi-bank services including store payments are required with API, it will be necessary to connect directly with each financial institution. Also, it will be necessary to consider organizing business rules and liabilities, instead of just connecting.

<Cases of multi-bank service>

	Open-API	CAFIS
Conceptual diagram		
Interface	Could exist for each bank.	Rules established for CAFIS I/F.
Liability (responsibility boundary)	Need to be organized for each bank.	Determined by payment brand rules, etc.
Business operation	Need to be organized for each bank.	Matured processes such as sales data creation/summary return function, security function and charge back already exist.

NTT DaTa

④Advancing security measures

NTT DaTa

Increasing unauthorized use of credit transactions

- While credit card transactions are increasing in accordance with expansion of EC and shift to cashless payment, the number of card information leakage cases are increasing by unauthorized access targeting merchants with insufficient security. As a result, damages by unauthorized use of stolen card information such as by counterfeit cards and spoofing are increasing every year.

Amount of damages by unauthorized use of credit cards in Japan

Billion yen

- Counterfeit damages
- Number theft damages (※1)
- Other unauthorized use damages

※2 For 2018, statistics data for 6 months from January to June (11.5 billion yen) and expected value estimated from the same are shown.

40

NTT DaTa

Actions taken by the government and international brands

> • Such increase of unauthorized use is a pressing issue in the industry, and the government and international brands are giving various instructions to issuers and acquirers to take measures to meet the situation.

Actions of the government

Credit Transaction Security Council formulated an action plan for security measures in credit transactions, part of which is mandated by laws and regulations.

7. Three pillars of measures in Action Plan

(1) Credit card information protection measures

Do not let card information get stolen
- Non-retention of card information at merchants
- Compliance with PCI DSS of operators retaining card information

(2) Countermeasures for unauthorized use by card counterfeiting prevention

Do not allow use of counterfeit cards
- "100% use of IC" for credit cards
- "100% support for IC" of payment terminals

(3) Countermeasures for unauthorized use of credit cards in non-face-to-face transactions

Do not allow spoofing
- Introduction of multifaceted and multi tiered countermeasures for unauthorized used according to risks

Actions of international brands

Industrial organizations lead by international brands (EMVCo.(*1), PCISSC(*2)) continuously require various security measures for face-to-face and non-face-to-face transactions.

● **Security enhancement for face-to-face payments**
- Ongoing revision of EMV specifications for IC card communications
- Development and revision of various security standards such as PCI DSS((*3)) and PCI CTS((*4))

● **Security enhancement for non-face-to-face**
- Presentation of "3D-Secure" Ver2.0 which is an ID protocol for non-face-to-face payment using credit cards

*1) EMV Co.: an organization developing globally common specifications related to credit card payments and authorizing the technology, comprised of 6 international brands (Visa, Mastercard, JCB, American Express, Discover, 銀聯 (UnionPay)) as board members. NTT DATA is involved in formulating specifications of 3-D Secure2.0, development, and implementation planning as technical associate member of EMVCo.
*2) PCI SSC: abbreviation of PCI Security Standard Council, which is comprised of American Express, Discover, JCB, MasterCard, and Visa. It is an organization which develops and manages PCI DSS which is a security standard for card payments.
*3) PCI DSS: global security standard in the credit industry stipulated by PCI SSC.
*4) PCI CTS: security standard related to terminals and hardware on which PIN is entered

NTT DATA

1.5 Example of growth strategy and efforts

NTT DATA

Basic policy of CAFIS' growth strategy

- We will create and provide new values for merchants and financial institutions while maintaining and enhancing CAFIS' network values (conventional core business domain) that come from being connected with the entities.
  - （A） Expansion of added value services for merchants
  - （B） Expansion of merchant agent functions
  - （C） Service provision meeting common needs of financial institutions

Direction of CAFIS' growth strategy

State of merchants

State of financial institutions

New Added values

**Conventional core business domain
(network value)**

New added values

(A) Added value services for merchants

- Digitalization of consumers' purchase experience and payment are closely related. Customer transfer from external entity is also necessary.

- Workload created by diversification of payment methods and technology compliance (i.e. security measures such as non-retention of card information) is the issue.

+

Service enhancement

(B) Expansion of merchant agent function

+

CAFIS

+

(C) Service provision meeting common needs of financial institutions

- Complying to accommodate tokenization and new authentication functions is troublesome
- Online related functions do not differ so much between the banks making if efficient for the integration

① **Changes on the merchants' side**

② **Diversifying payment methods**

③ **Changes on the Financial institutions' side**

④ **Advancing security measures**

43

NTT DaTa

(A) Expansion of added value services for merchants "CAFIS Arch"

- In the past, payment terminals had applications installed inside, so when adding/deleting payment applications, they either had to be sent back or an on-site technician had to be dispatched for maintenance.
- "CAFIS Arch" keeps payment applications at the "center", and since maintenance is performed only at the center, it immediately enables the use of new functions on the terminals. It provides highly added values to merchants by continuously enhancing functions and expanding devices, supporting implementation of digital experience.

(A) Expansion of added value services for merchants: "CAFIS Pitt"

- "CAFIS Pitt" is a "payment platform" for implementing smartphone payments using QR codes/NFC(*1).
- Provided as merchants' exclusive wallet, it enables enhancement of customer touch points and merchants' data usage.
- Moreover, through collaboration with marketing solutions such as CAFIS Explorer and the store-side platform CAFIS Arch, it improves purchase experience of customers and their retention, contributing to the creation of payment opportunity itself.

CAFIS Pitt

From April 2018,
Adopted as the platform for ".pay (dot pay)" of Tokyu Corporation

(A) Expansion of added value services for merchants: "support for overseas visitors and digital marketing"

- All services from customer transfer for visitors to Japan to product description in multi language, various overseas visitor payments, tax exemption process, and cross-border EC after returning to a home country, are provided by CAFIS.
- Solutions combining payment and next-generation digital marketing are provided both for customers living in Japan and overseas visitors respectively.

(B) Expansion of agent functions for merchants: code payment GW

- We are planning to provide a service which allows connecting with multiple code payment providers collectively from the spring of 2019 for merchants who will connect with "code payment GW" provided by CAFIS when they introduce domestic/overseas code payments.
- We plan to increase the number of code payment providers one by one, and to support various one-dimensional barcode/QR code payments.

47
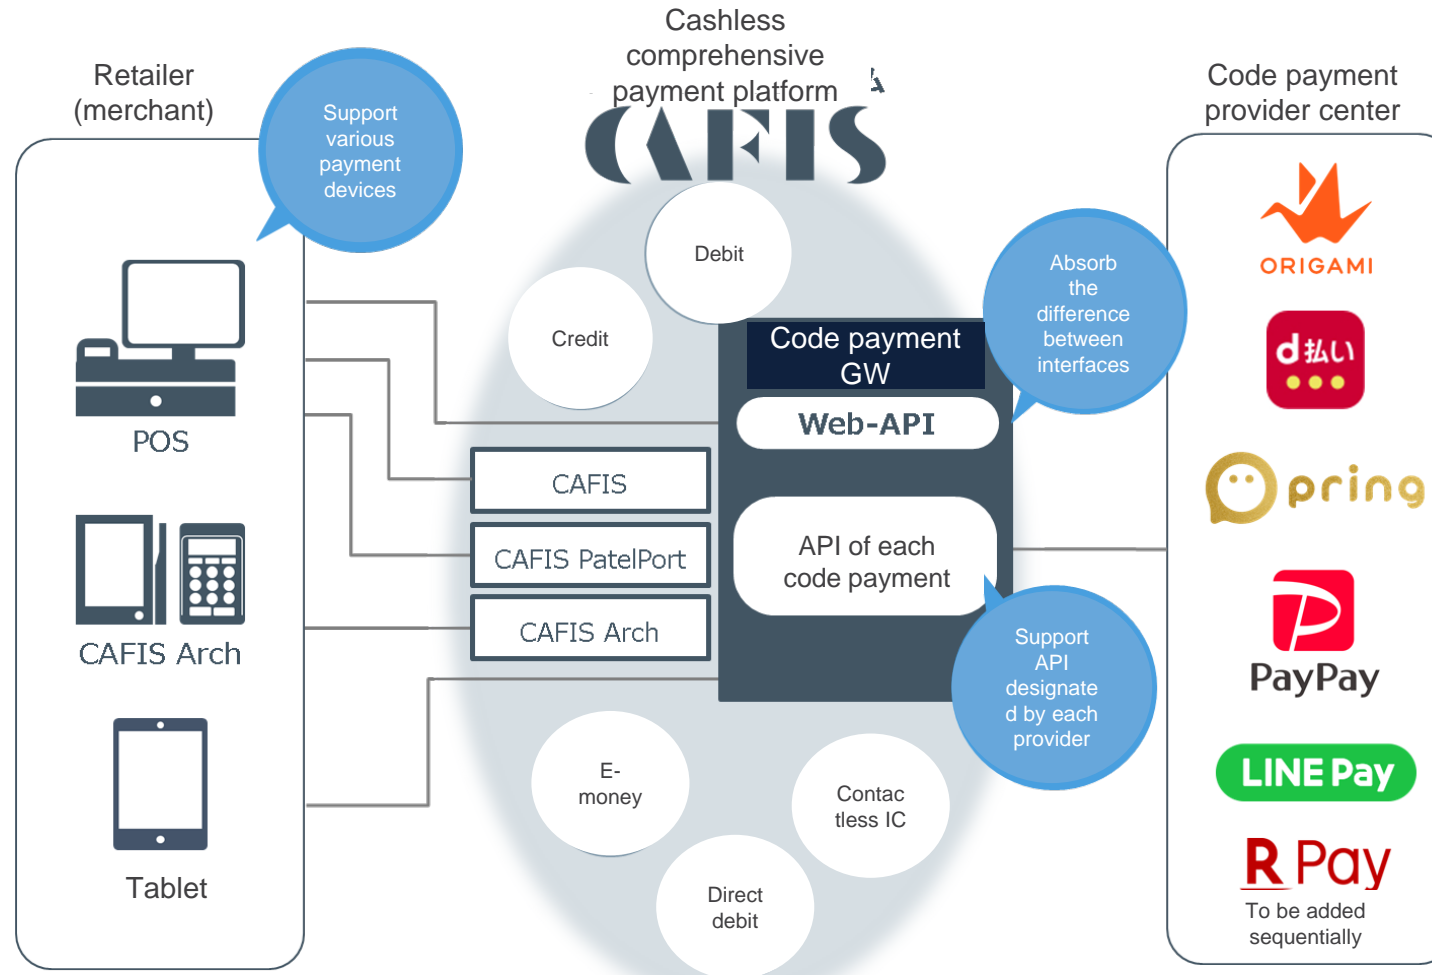

[Reference] code payment GW provision scheme

- There are two provision schemes for the code payment GW services.
- Basically, overseas code payments service will be provided by "processing & comprehensive contract" scheme and domestic code payments service will be provided by "processing" scheme. (Policies of each code payment provider will be followed.)

"Processing & comprehensive contract" scheme

- NTTD will sign a comprehensive merchant contract with a code payment provider.
- Relay GW will be provided to code payment providers.
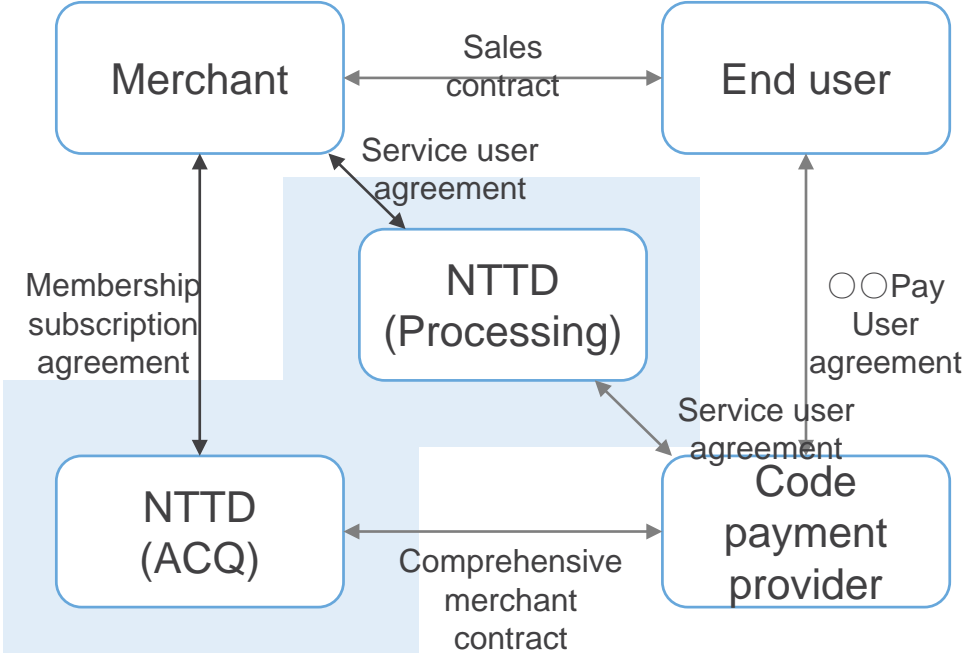

"Processing" scheme

- Relay GW will be provided to code payment providers.

NTT DaTa

(C) Service provision meeting common needs of financial institutions

- Compliance with security regulations inside/outside Japan, such as Action Plan of Credit Transaction Security Council, international brands regulations and PCI DSS, is a common issue for credit card companies. NTT DATA will provide a joint-use solution that meets those requirements to mitigate the burden of each credit card company, and will continue to work on achieving a safe card payment environment.

➢ **BlueGate user authentication service** is an authentication solution that mitigates risks of non-face-to-face payments by having issuers directly verify ID upon EC payment.
➢ **CAFIS Brain** is a fraud detection platform that prevents "spoofing" related to EC payments with device × rules × collective intelligence.
➢ **Non-retention** enables payments with card numbers (PAN) hidden, providing support for promoting PCI DSS measures of acquirers for merchants.

2. Global payment business

NTT DaTa

Global payment market

- APAC market is expected to continue to grow rapidly into a scale comparable to Western countries by 2025.
- In Asia, penetration rate of VISA/MasterCard, etc. is low, and various local payment methods are widely used.
⇒due to expansion of the payment market and co-existence of various payment methods, PSP's existence value for merchants is increasing in more countries.
